

Kivi

prototype screens

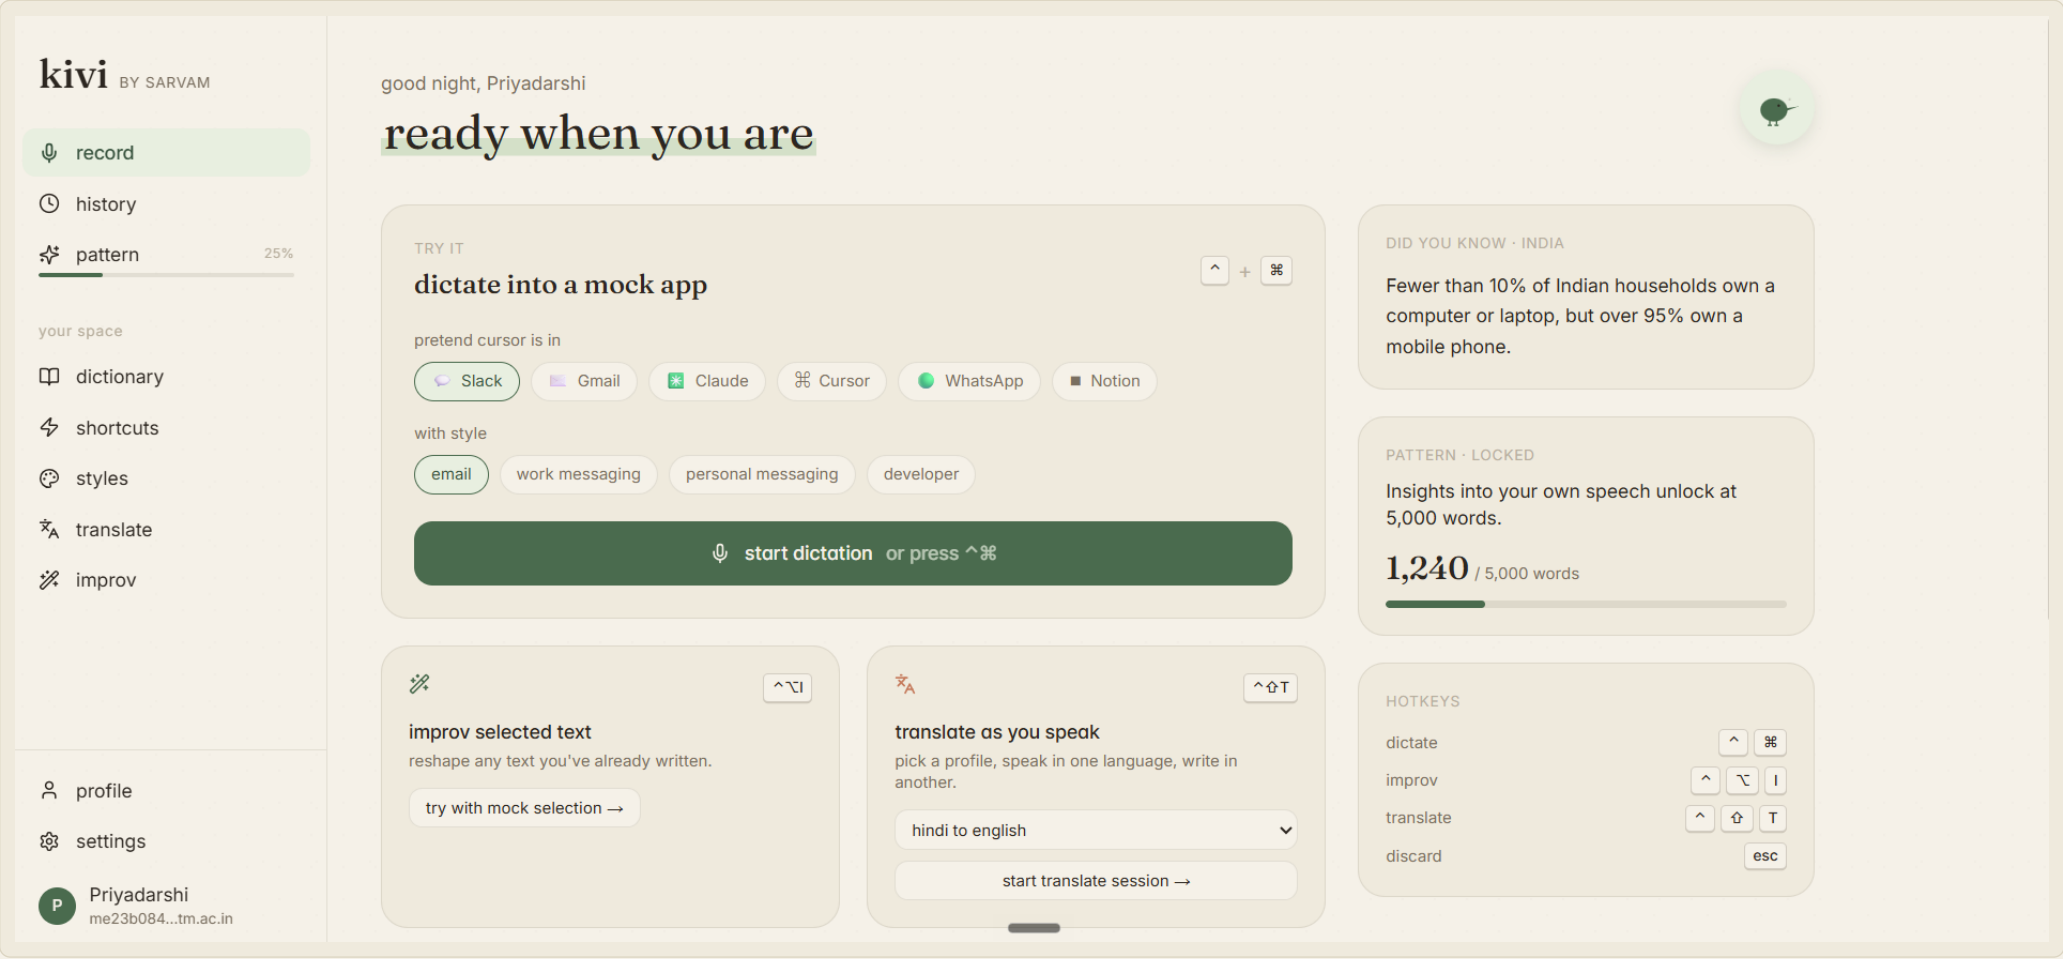

A UI/UX redesign of Kivi by Sarvam
Product UI/UX & Design assignment

Priyadarshi Ubale

September 2026

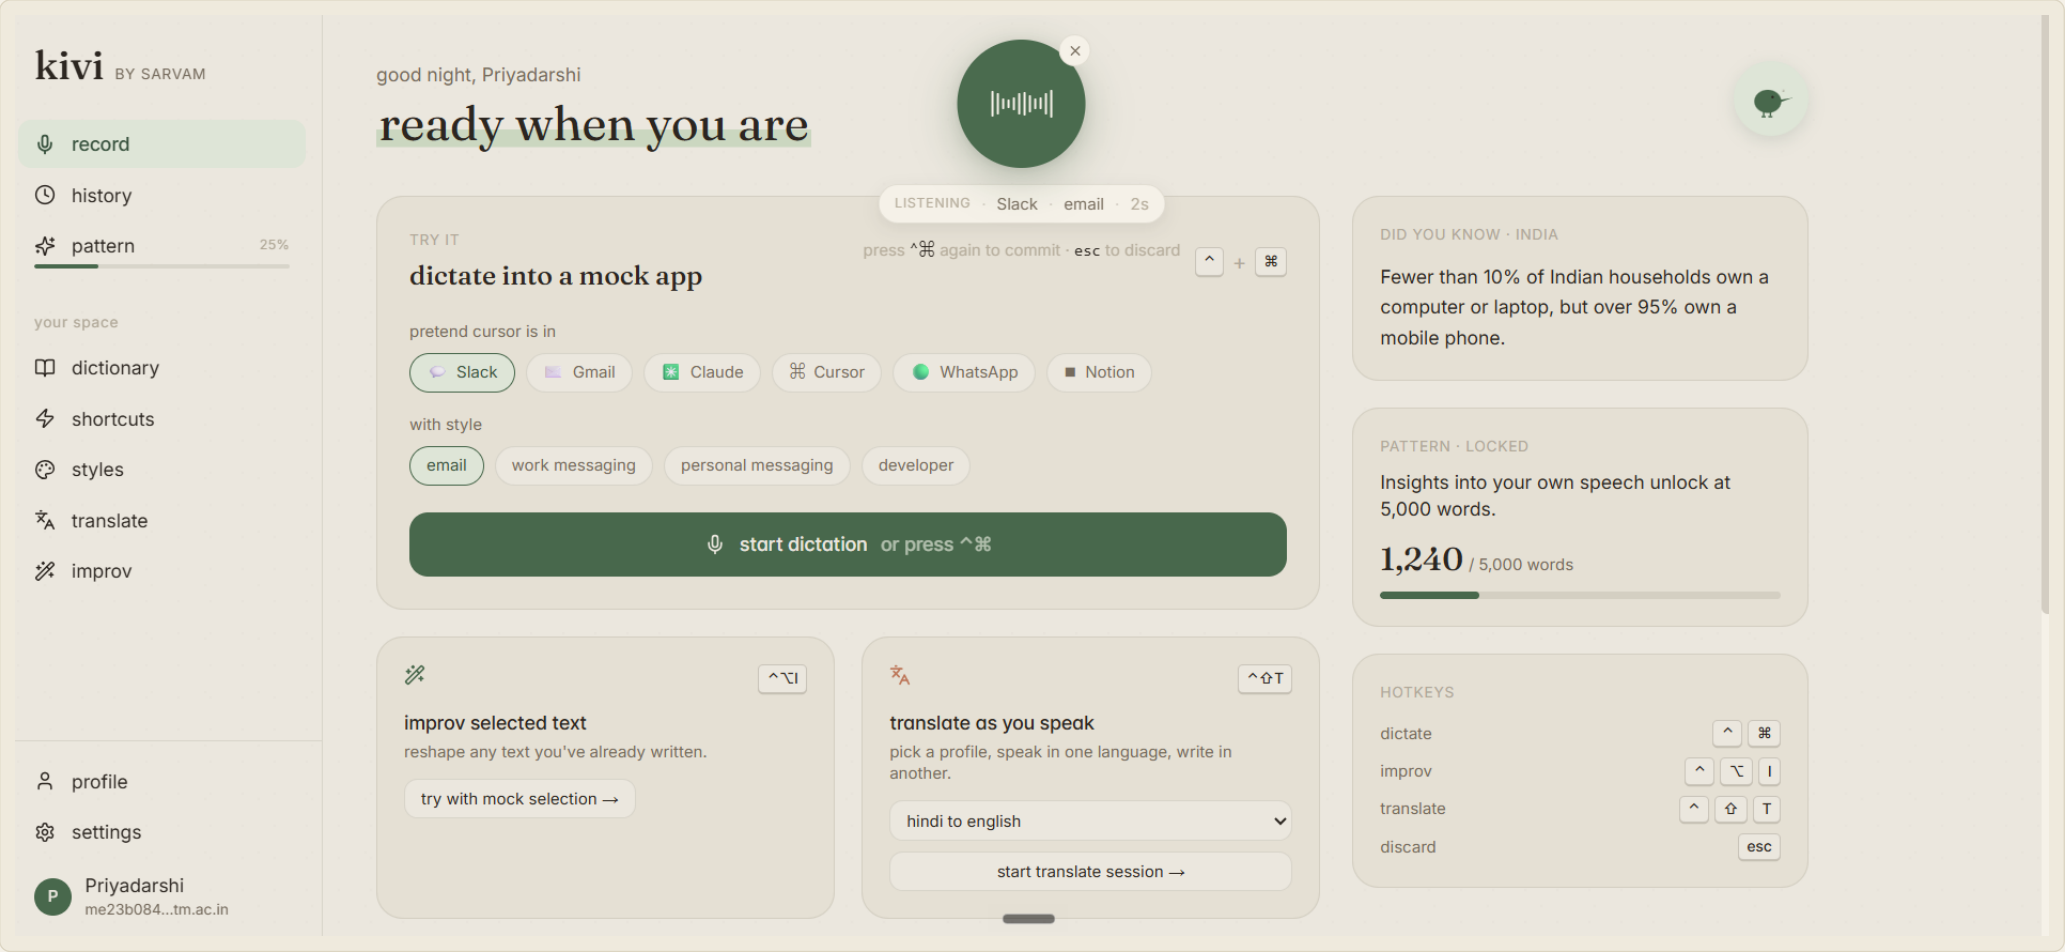

Record — the home screen

Time-of-day greeting, dictation-simulator card with app and style pickers, Improv and Translate quick-cards, hotkey cheatsheet, Pattern progress teaser, and the rotating fact card.

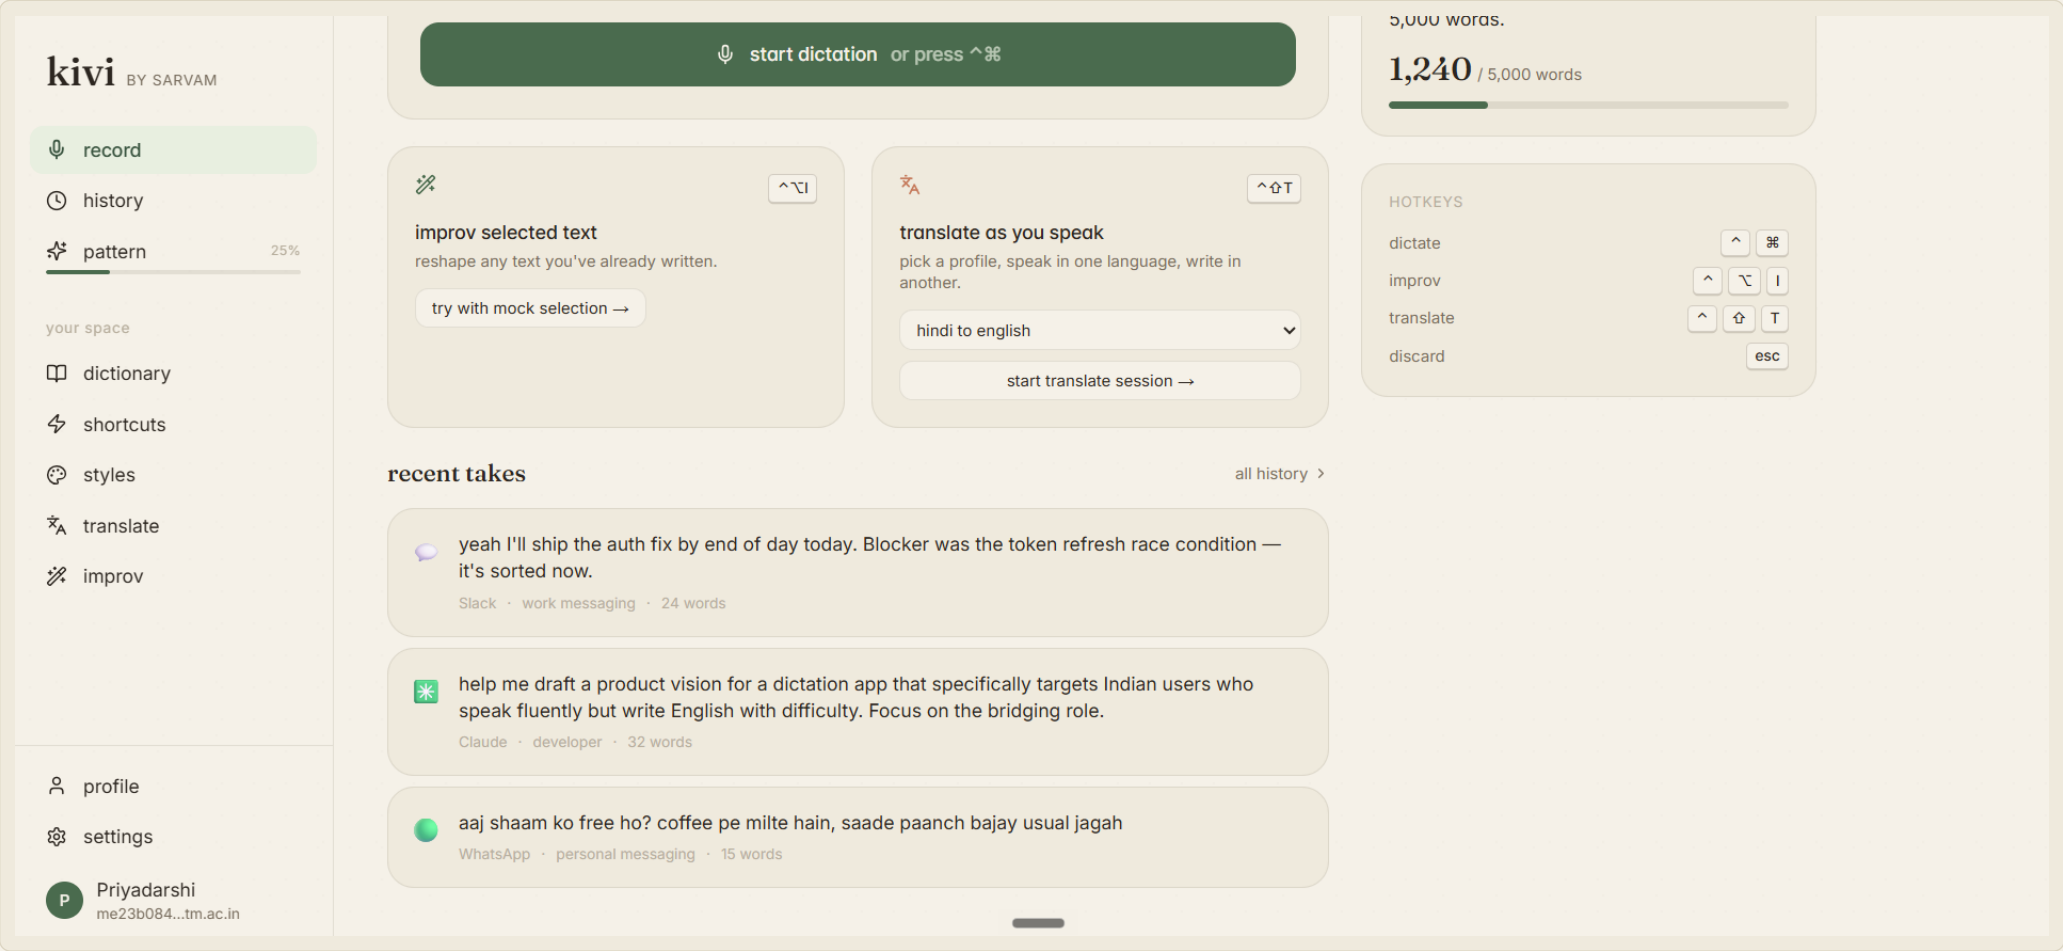

Record — active dictation session

Circle overlay at top of screen with radial waveform, active app and style shown, hint to press **⌘** again to commit or Esc to discard. The Kivi bird visible top-right.

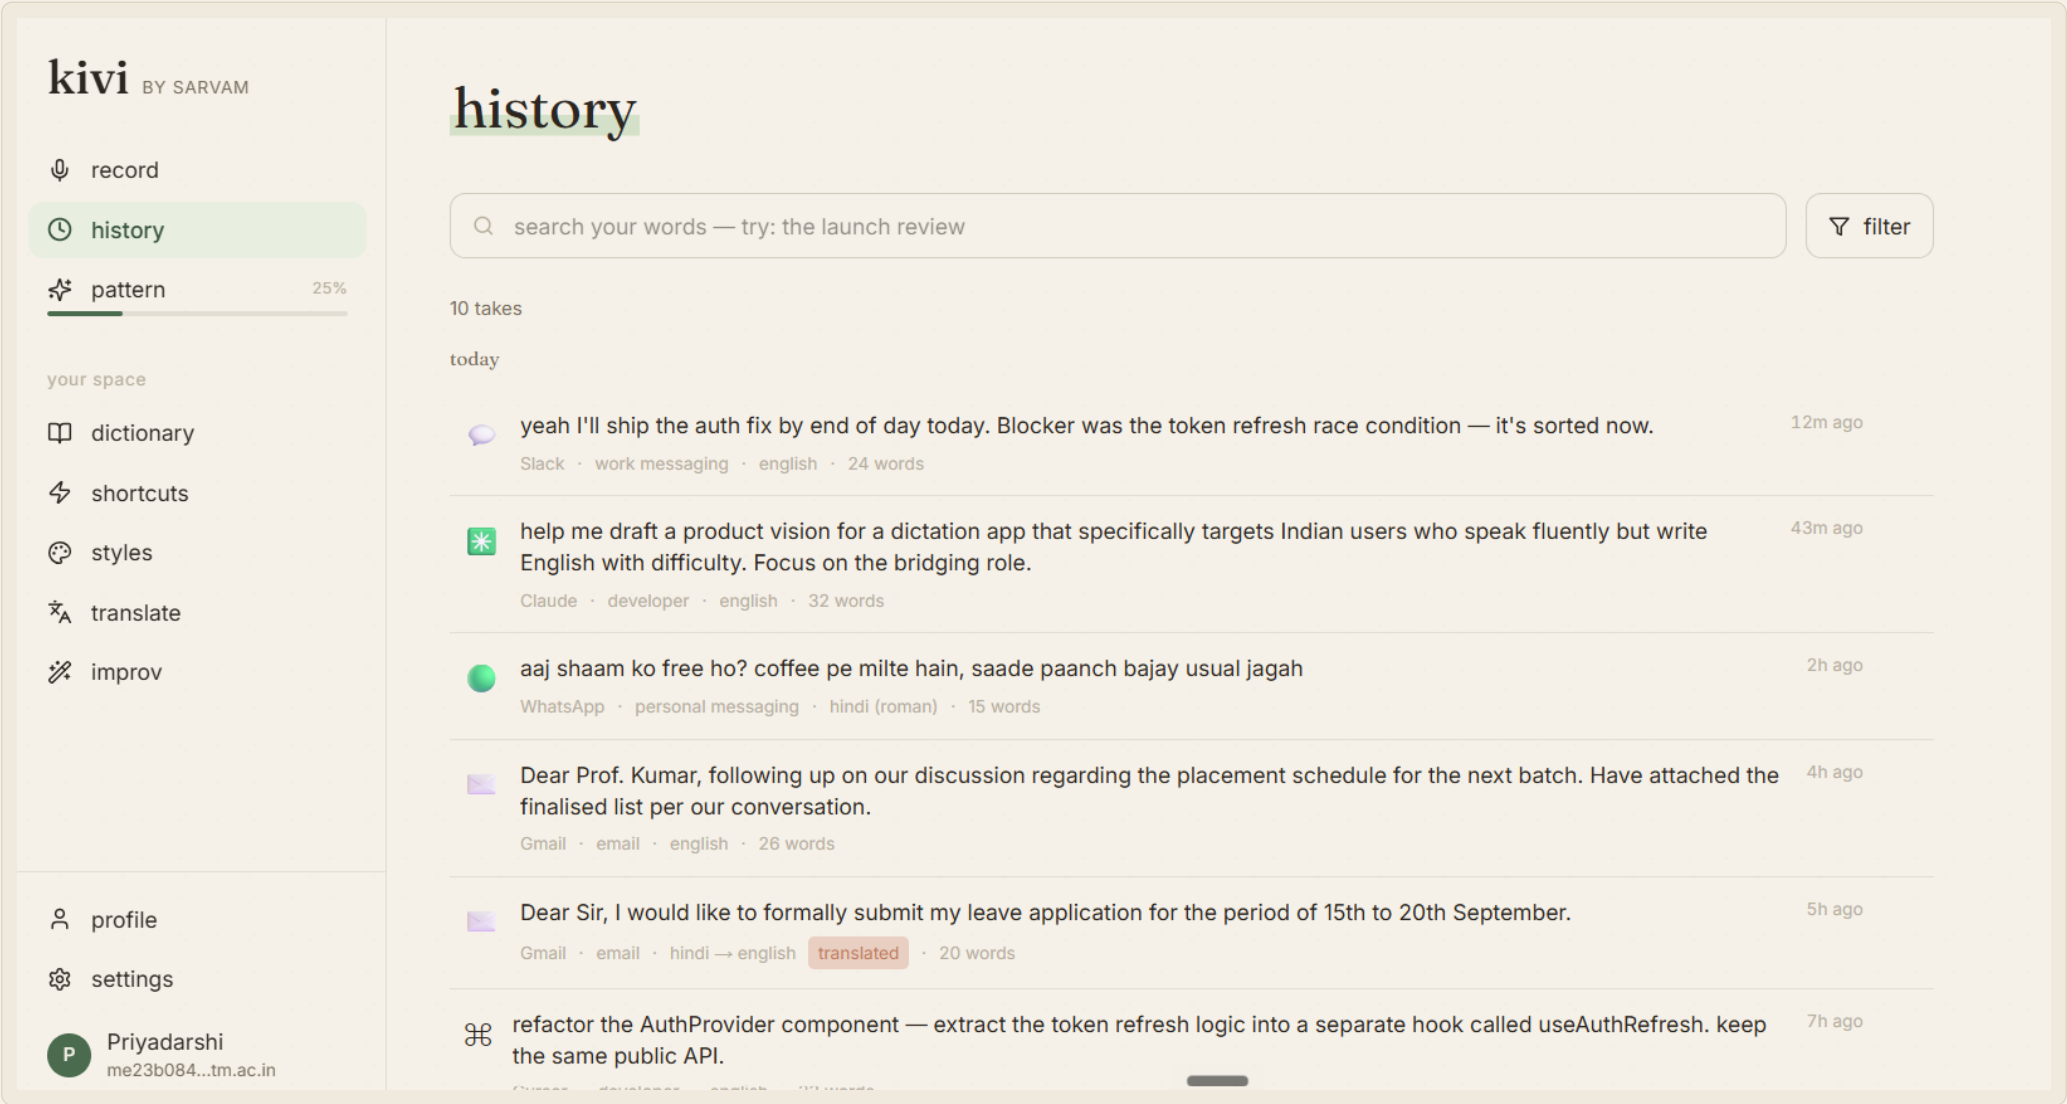

Record — recent takes

Below the dictation simulator: recent takes list with app icon, first line of transcript, style and word count. Improv and Translate cards to the left, hotkey reference to the right.

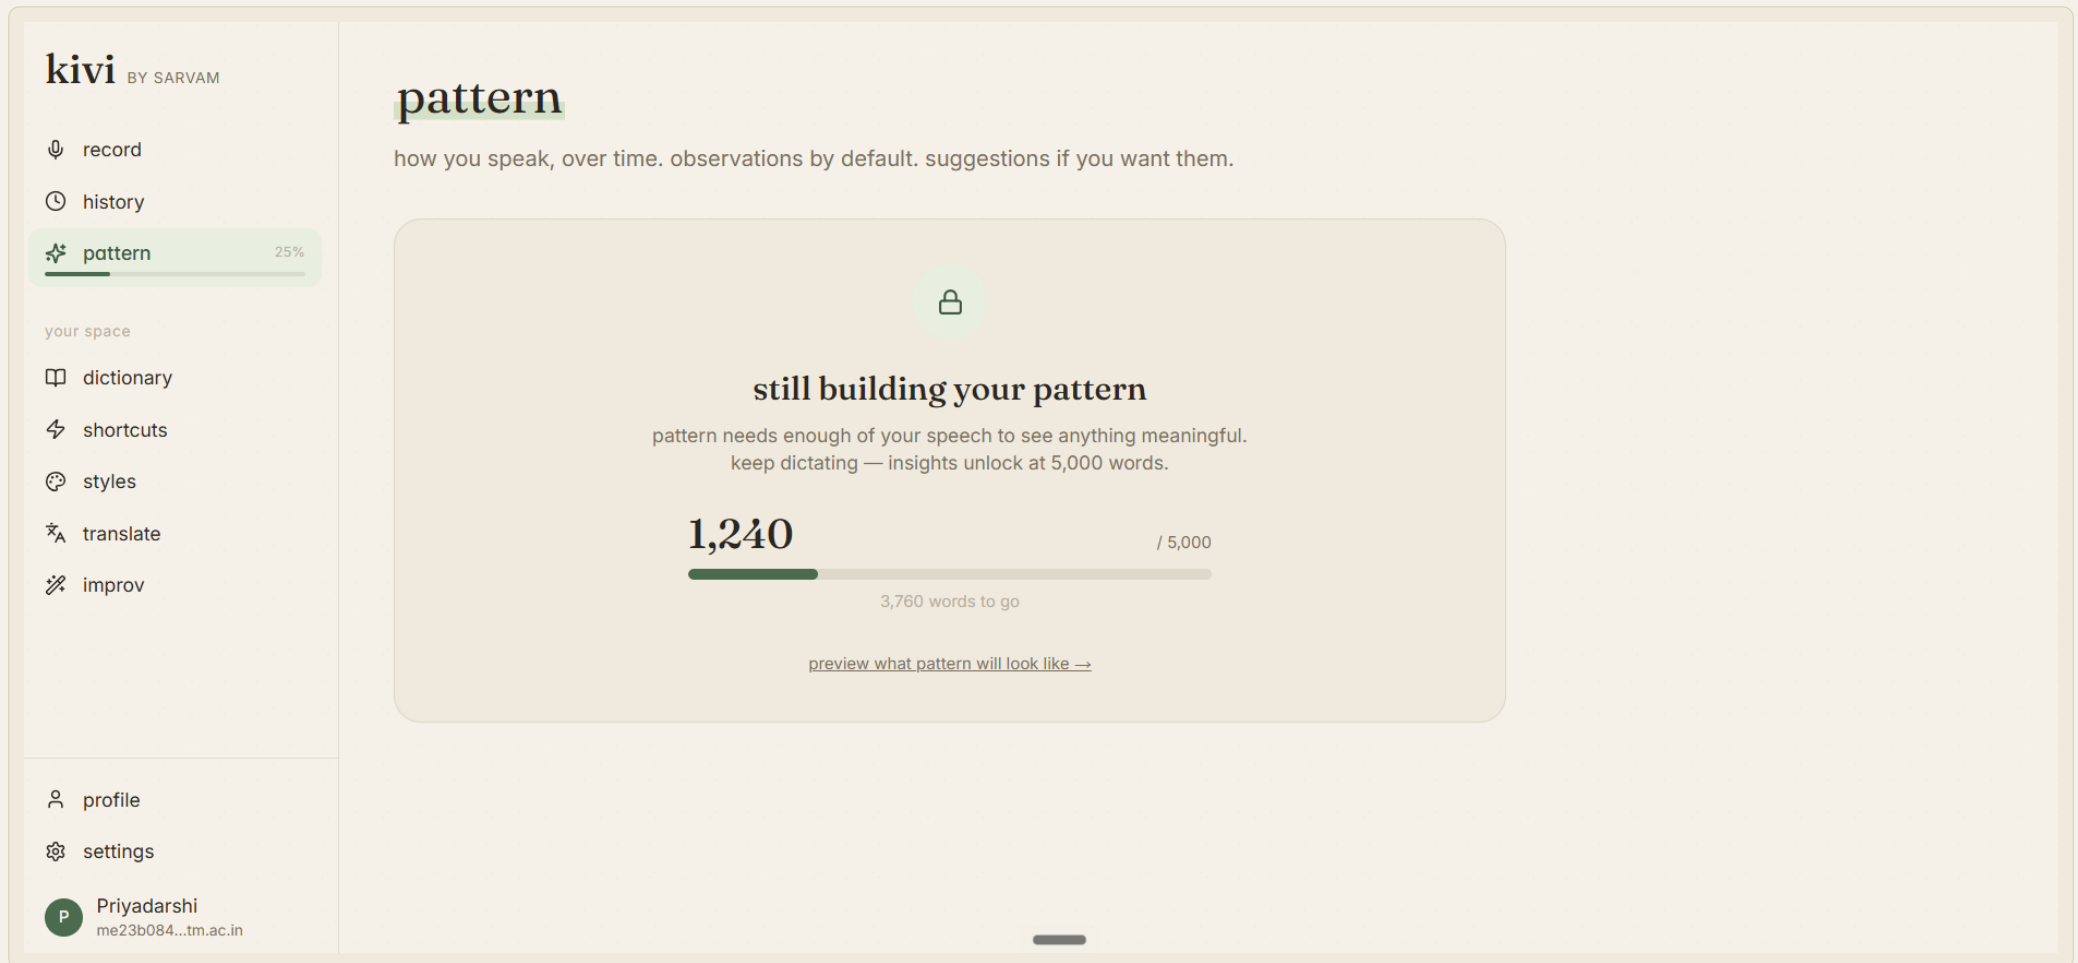

History

Every dictation grouped by day. Big search bar with a suggestive placeholder, filter dropdown, per-take app icon, transcript preview, style and language metadata, and a hover-to-copy action.

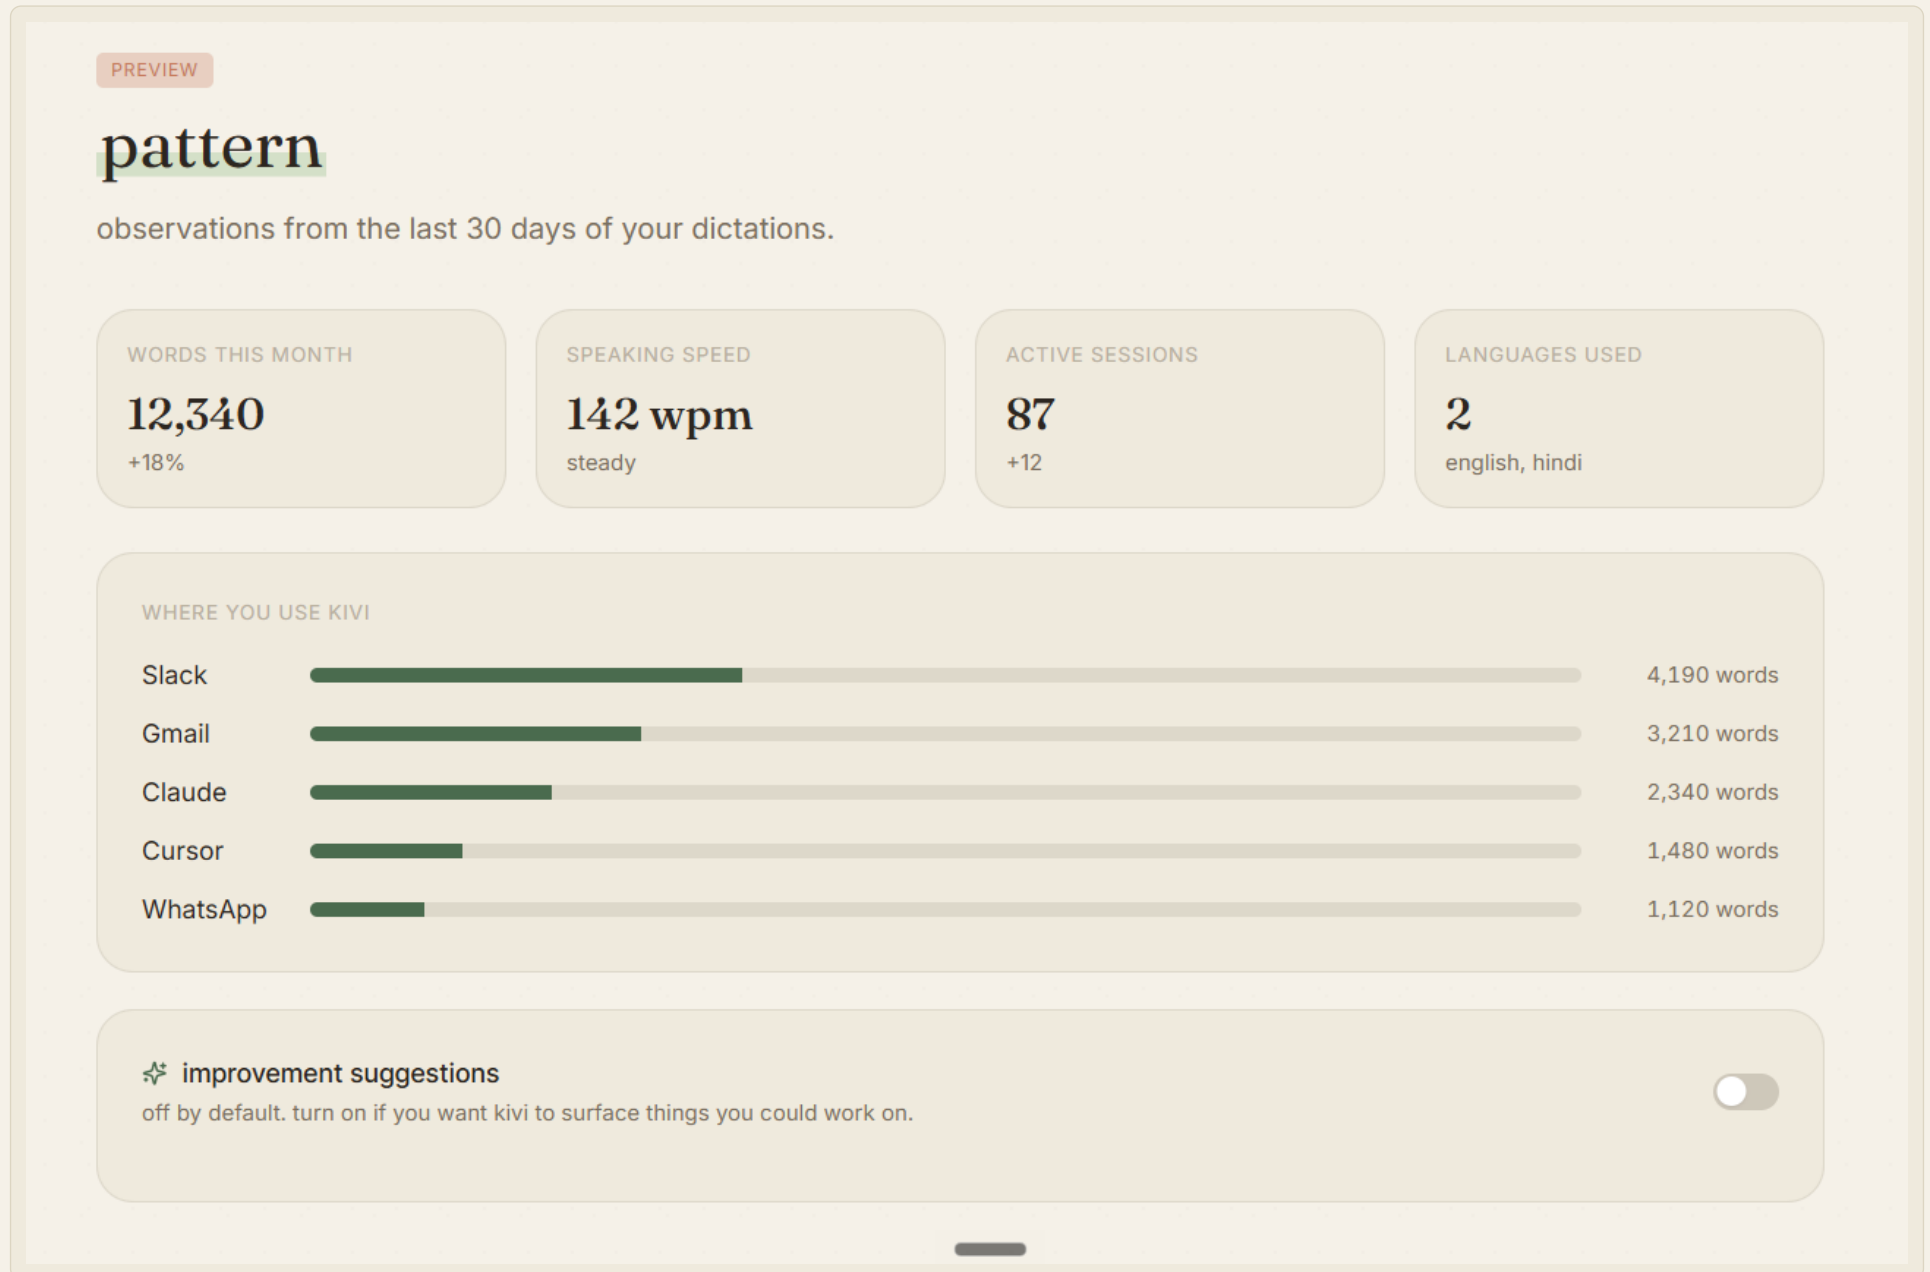

Pattern — locked

Locked until 5,000 words dictated. Shows progress bar with words-to-go count. A subtle link at the bottom lets the user preview what pattern will look like when unlocked.

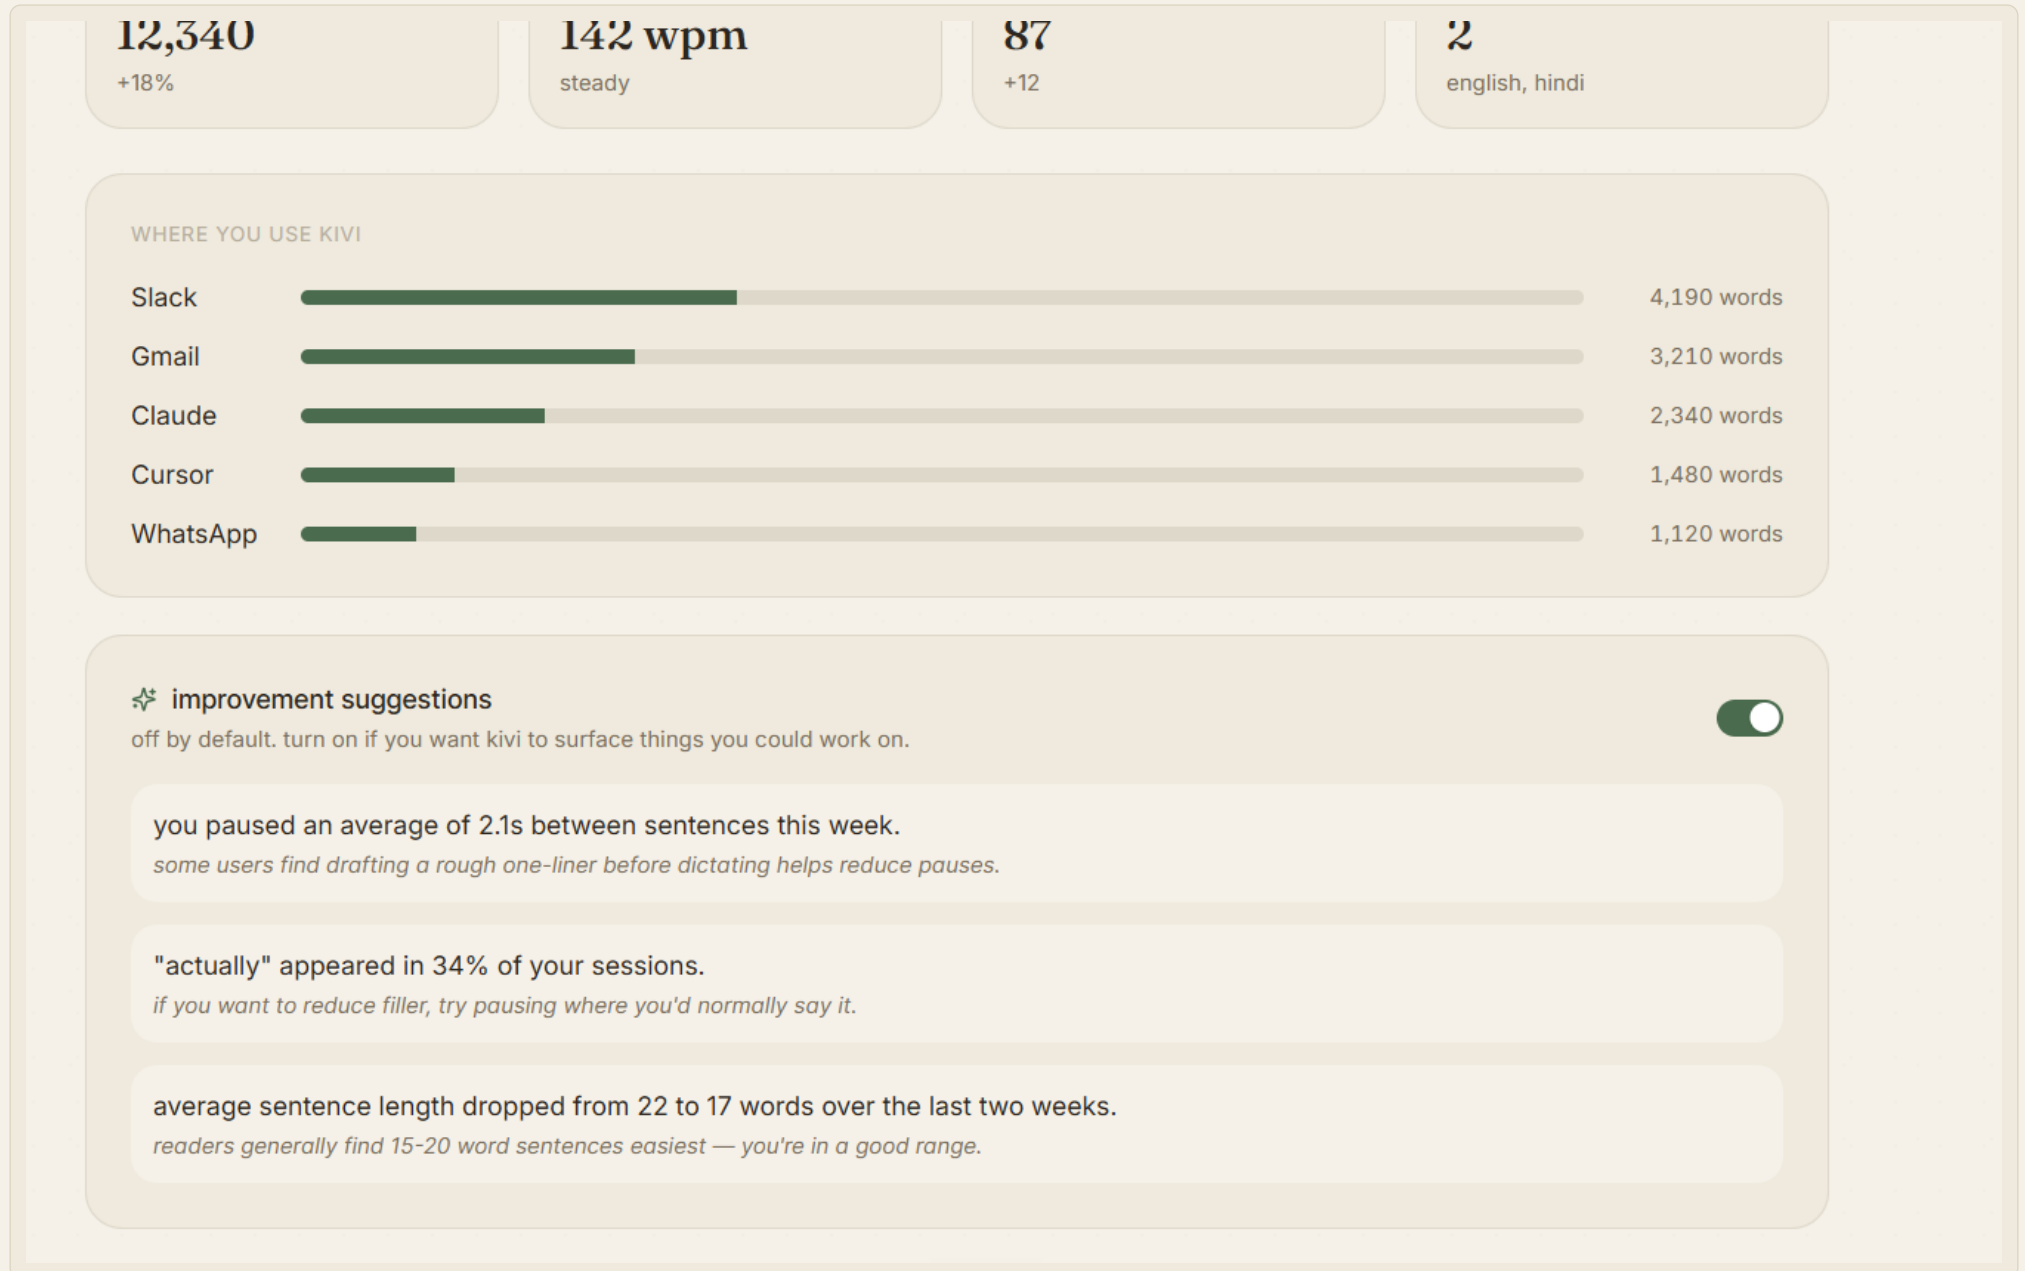

Pattern — preview (observations)

Observation-first framing: words this month, speaking speed, active sessions, languages used. App-by-app usage breakdown below. No judgment, no diagnostic claims.

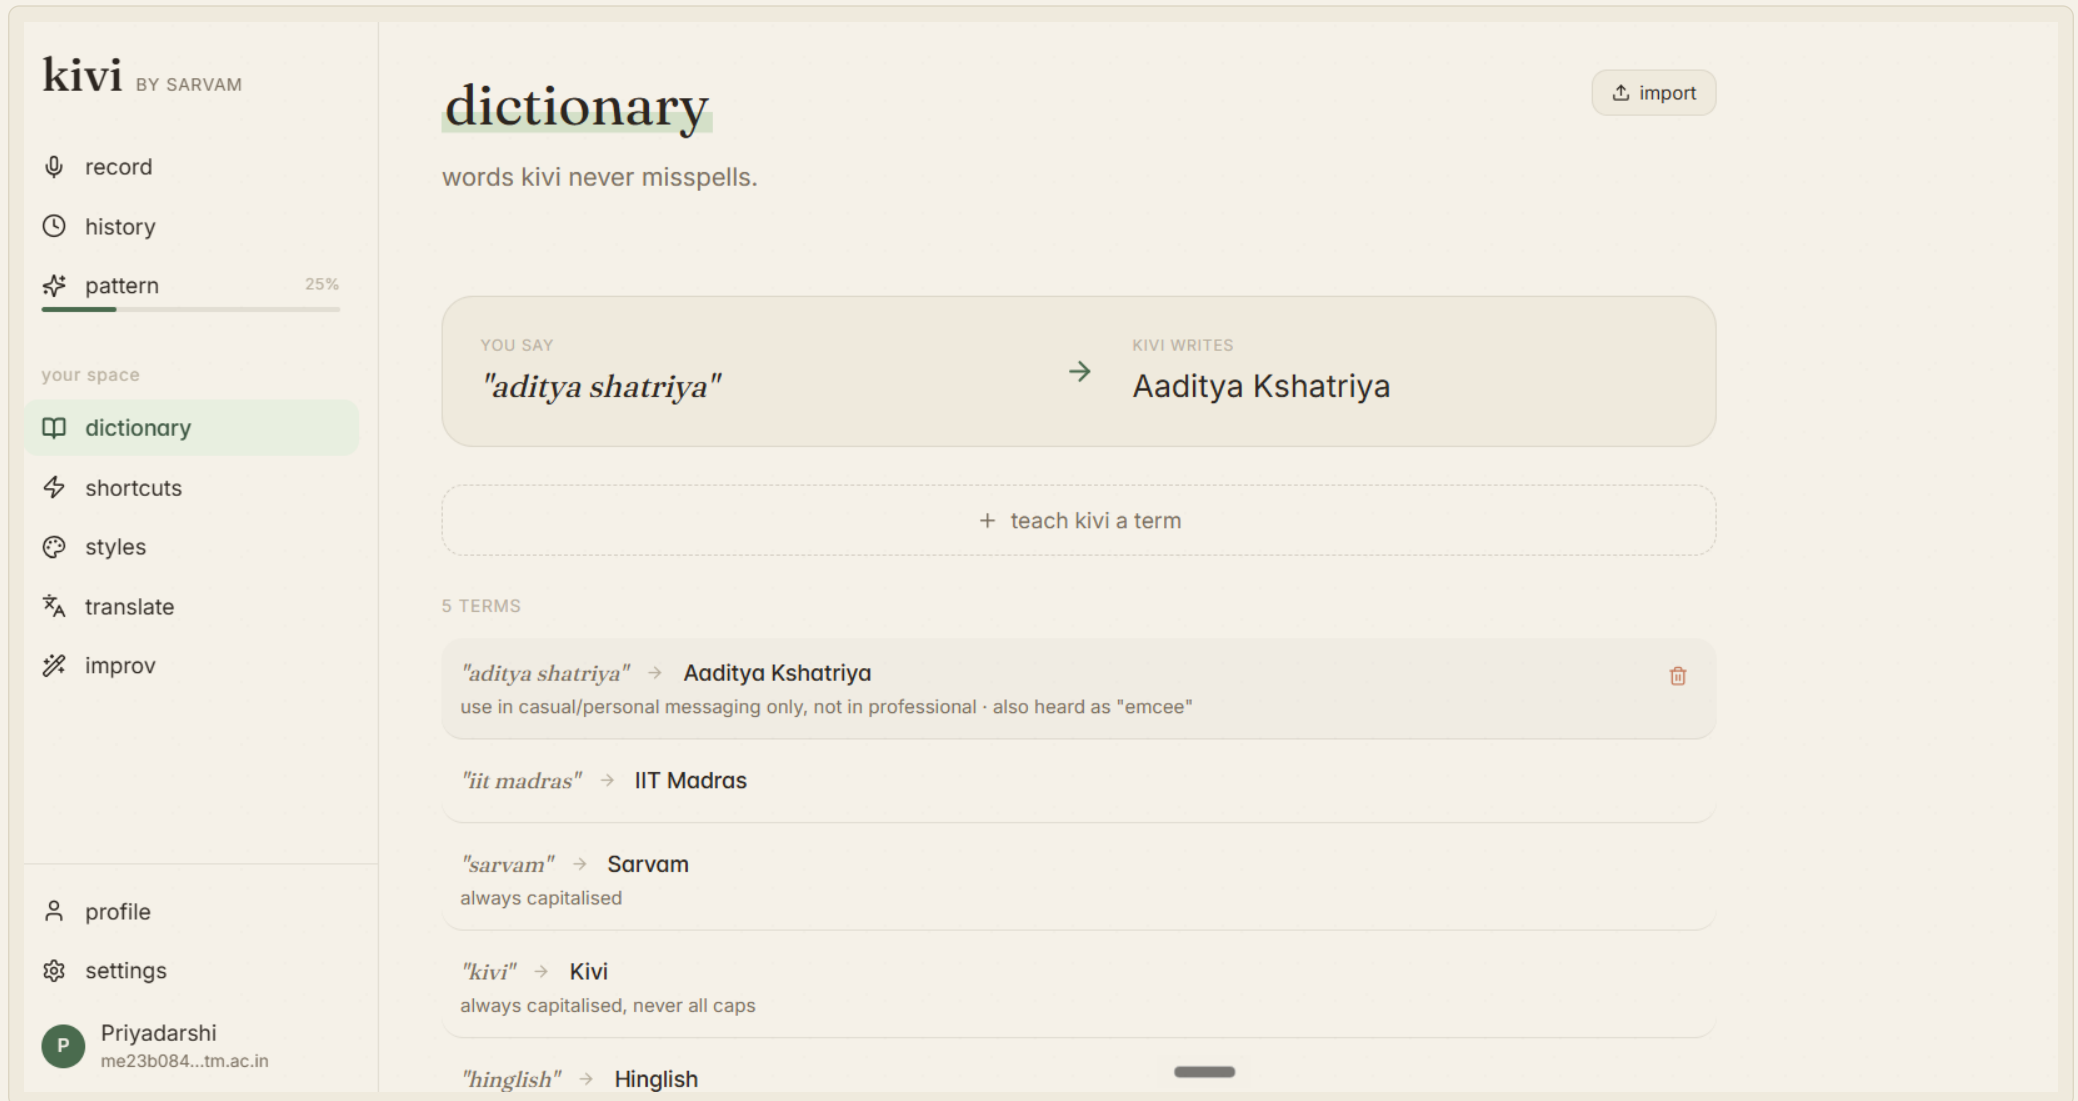

Pattern — preview (opt-in suggestions)

Improvement suggestions are off by default. When toggled on, kivi surfaces soft observations ("we noticed X, some users find Y helps") — never judgmental.

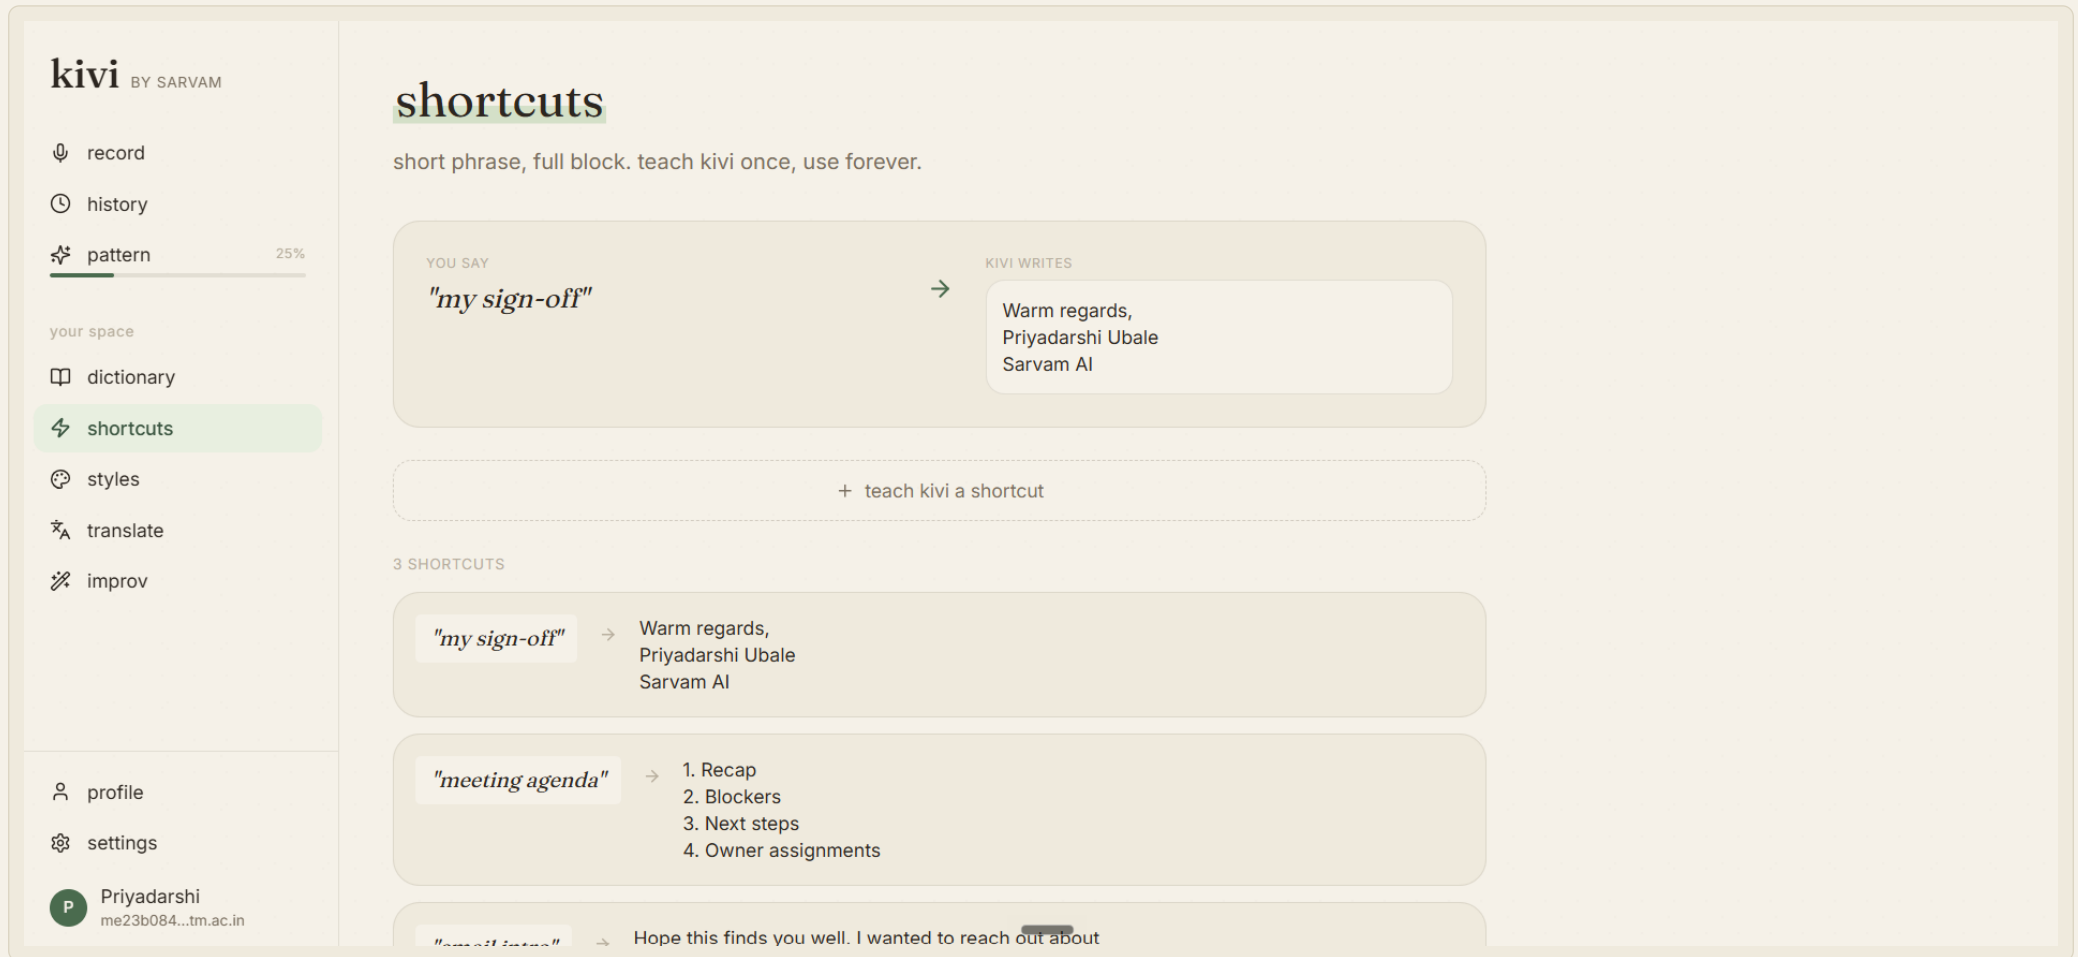

Dictionary

Words kivi never misspells. "you say → kivi writes" pattern with optional note and pronunciation hint. Add via teach-kivi-a-term. Import for bulk uploads.

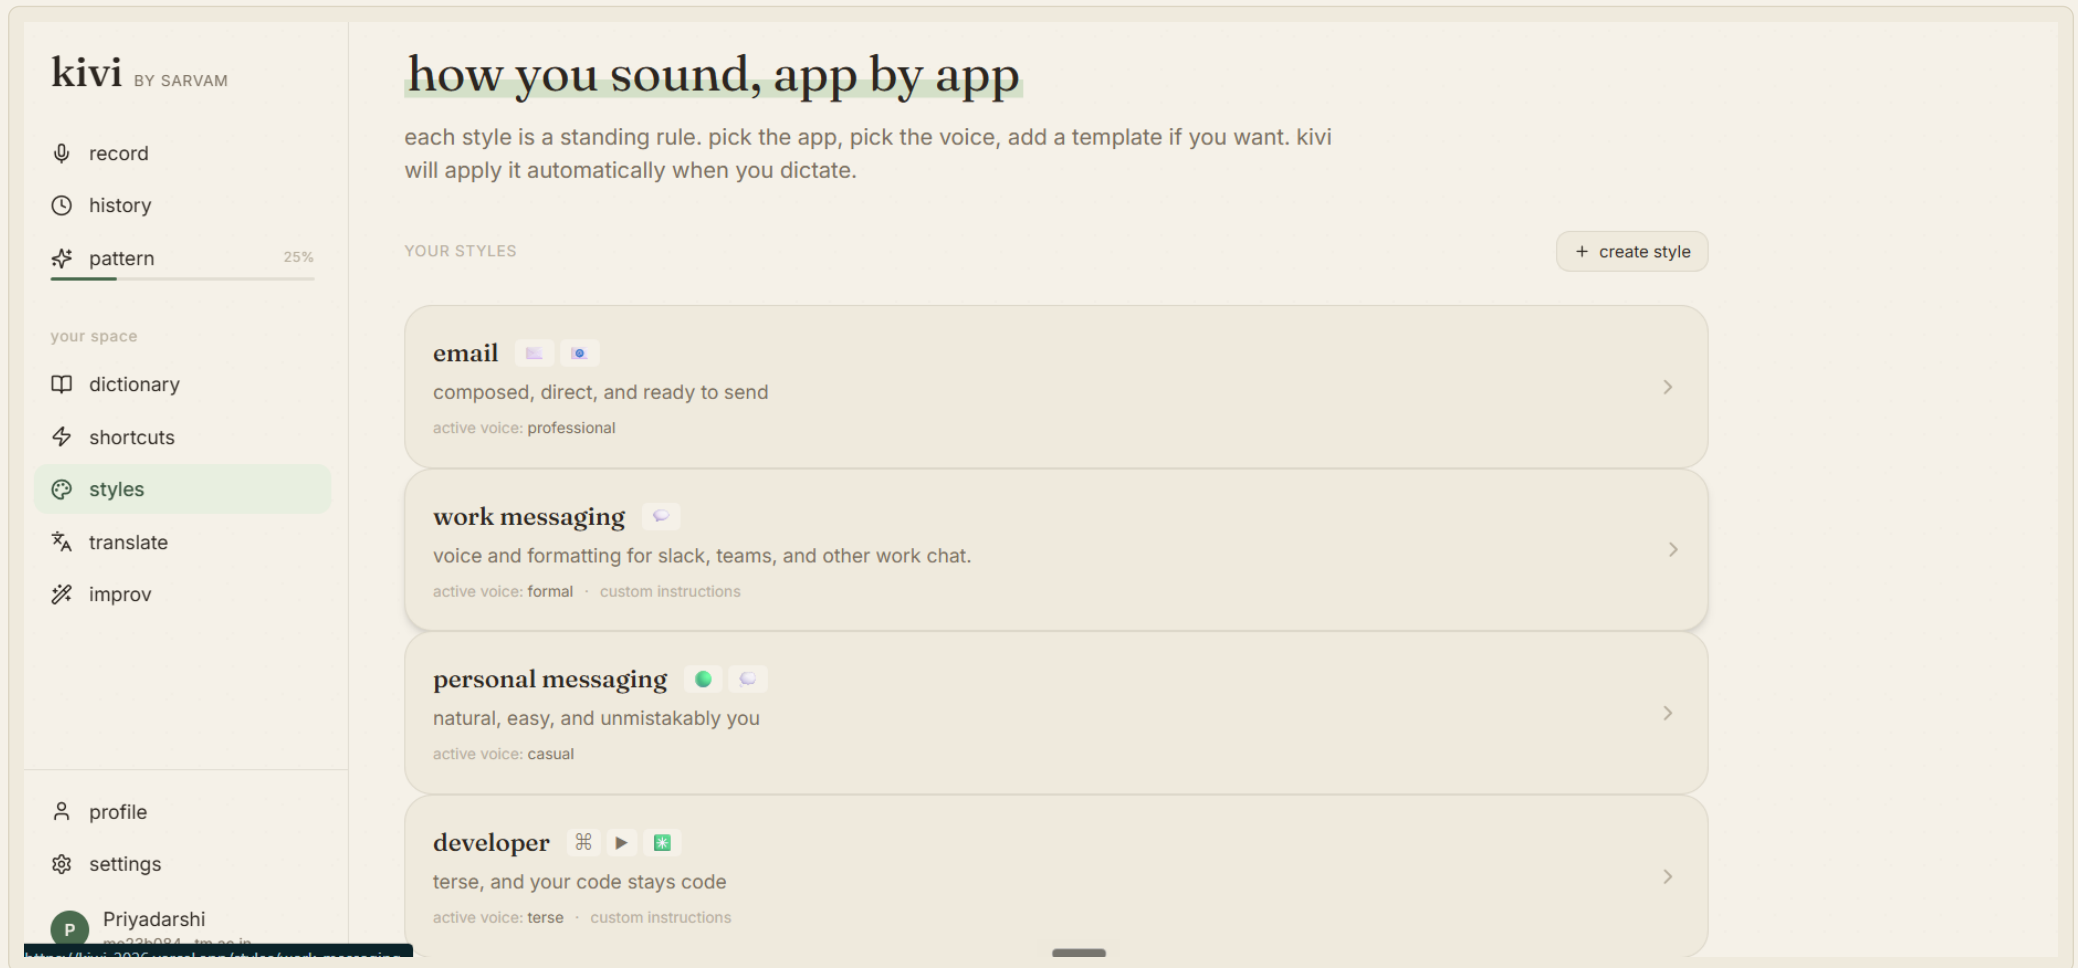

Shortcuts

Short phrase, full block. Say a trigger, kivi expands it into a saved snippet. Kept faithful to the current Kivi feature-wise; only rounded corners and spacing differ.

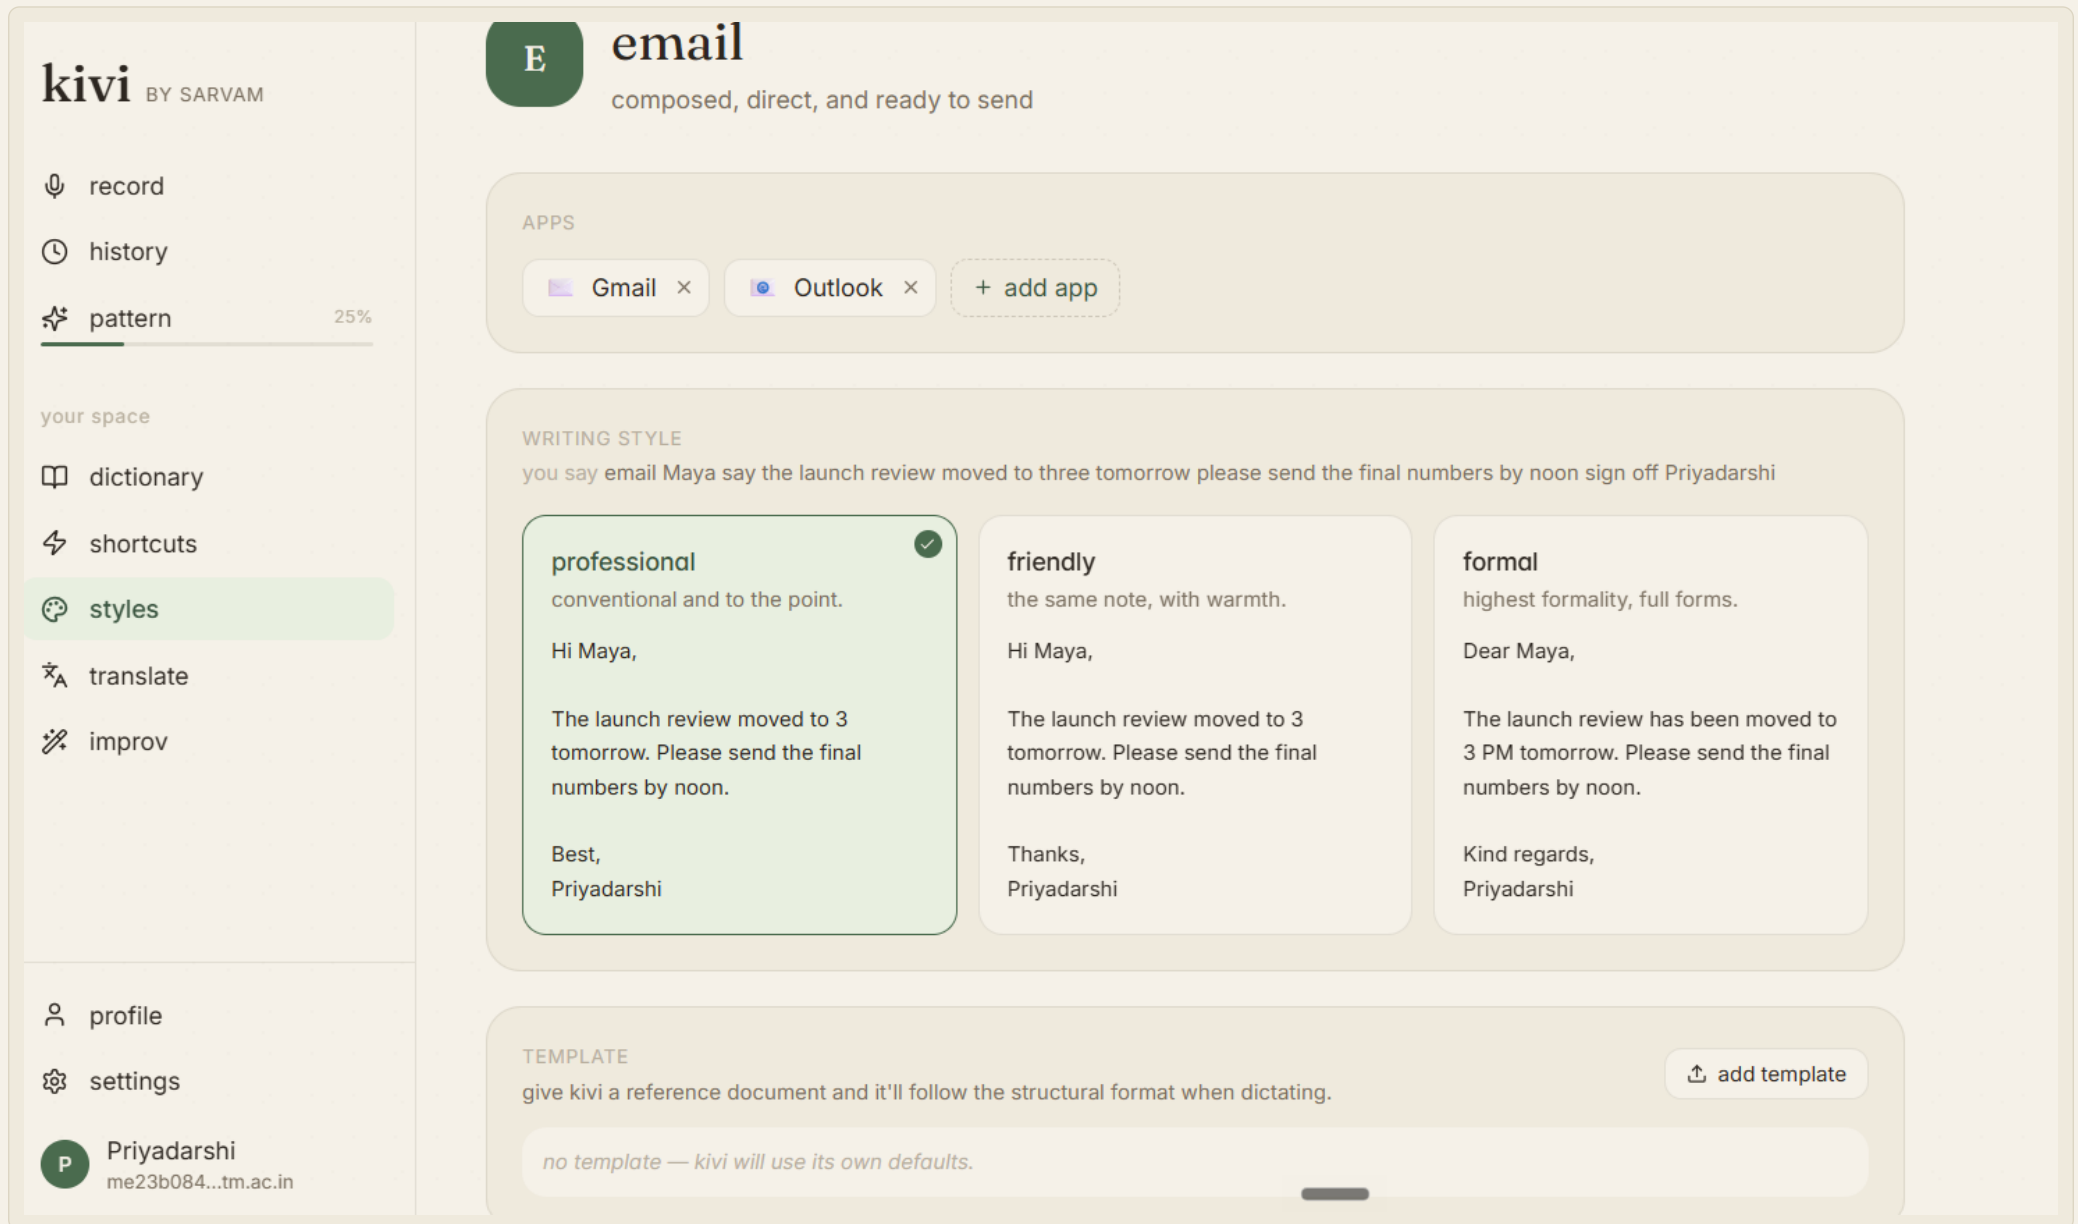

Styles — list

The star of the redesign. Rich preset bundles: apps + writing voice + template + free-form instructions. Default seeded styles: email, work messaging, personal messaging, developer.

Styles — editor with writing voices

Inside a style: apps applied, three writing-voice cards with live "you say → kivi types" previews, active voice marked with a check. This is the strongest UI moment in Kivi.

Styles — editor template & instructions

Template upload — kivi mimics structural format from a reference document (v1: format only, not voice or vocabulary). Below, free-form instructions for standing rules.

TEMPLATE

give kivi a reference document and it'll follow the structural format when dictating.

 add template

no template — kivi will use its own defaults.

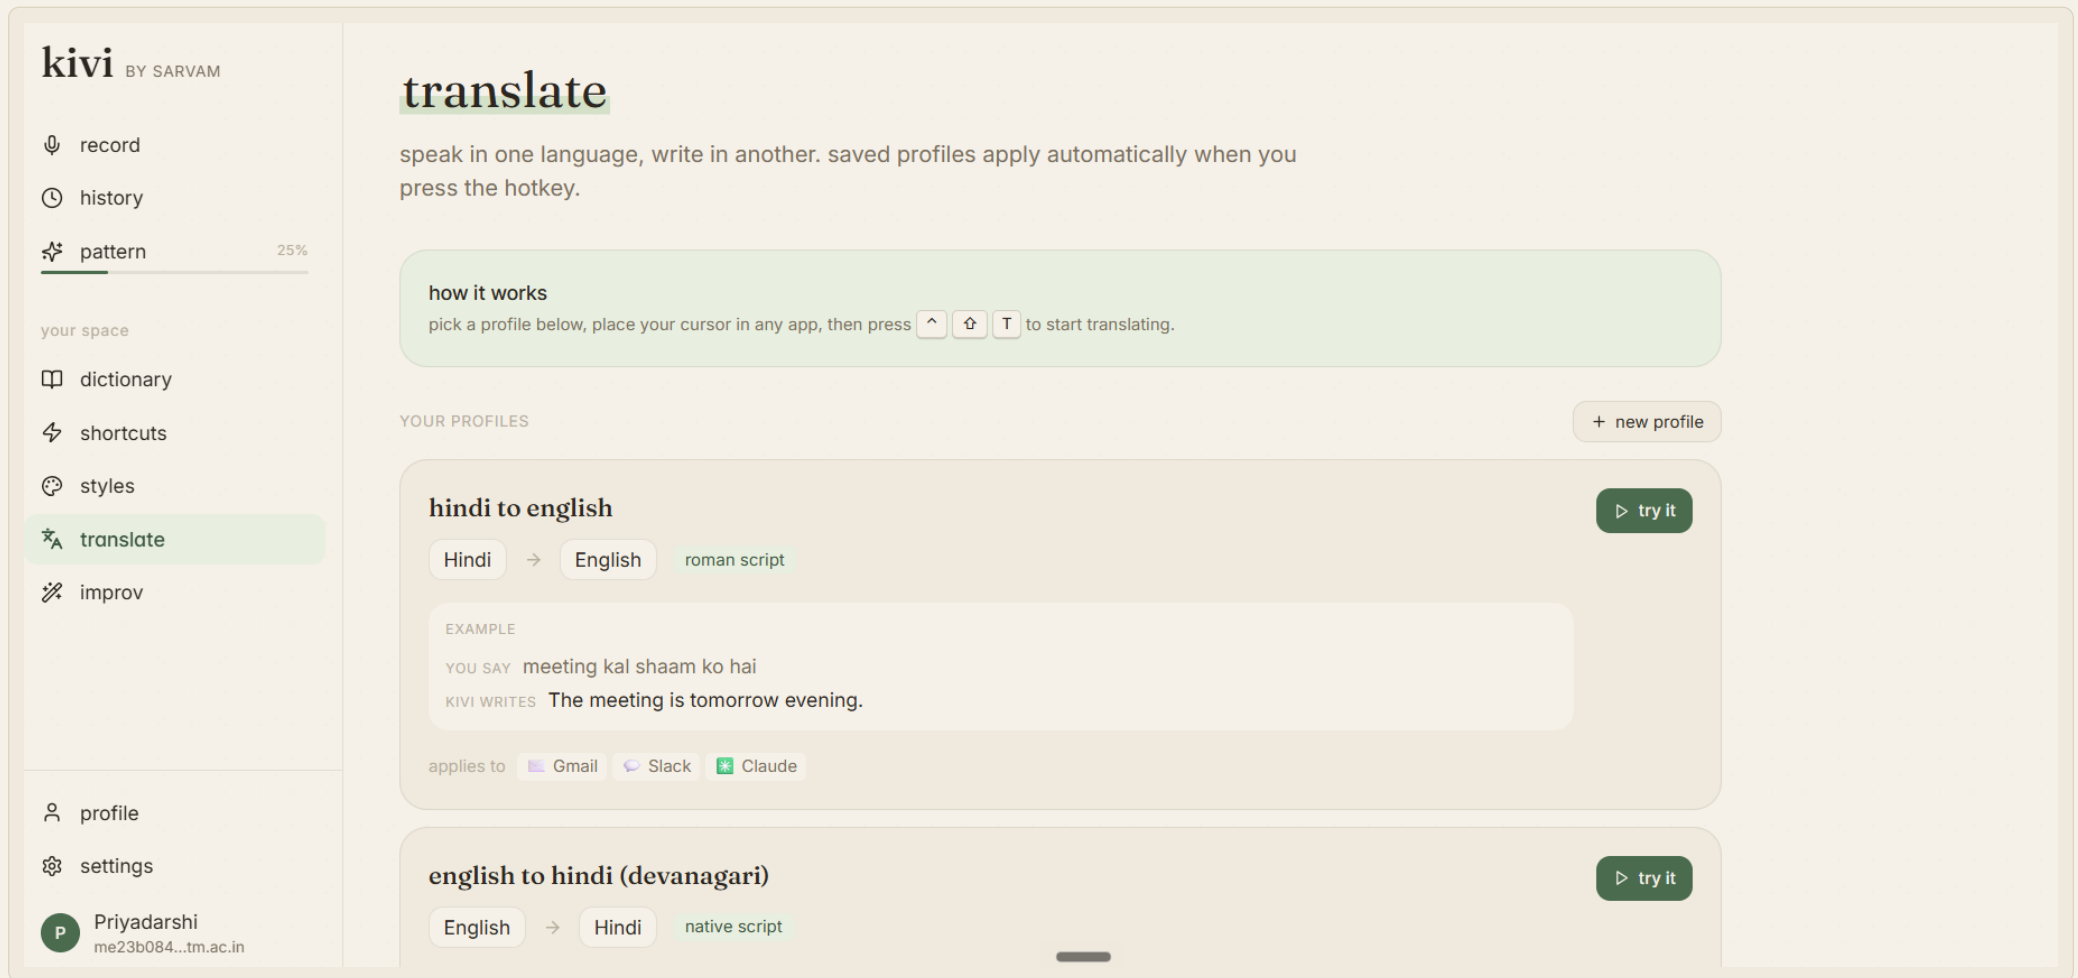

YOUR INSTRUCTIONS

standing rules for this voice — kivi will follow them every time.

tell kivi what to preserve, remove, or change — e.g. "always keep names in English"

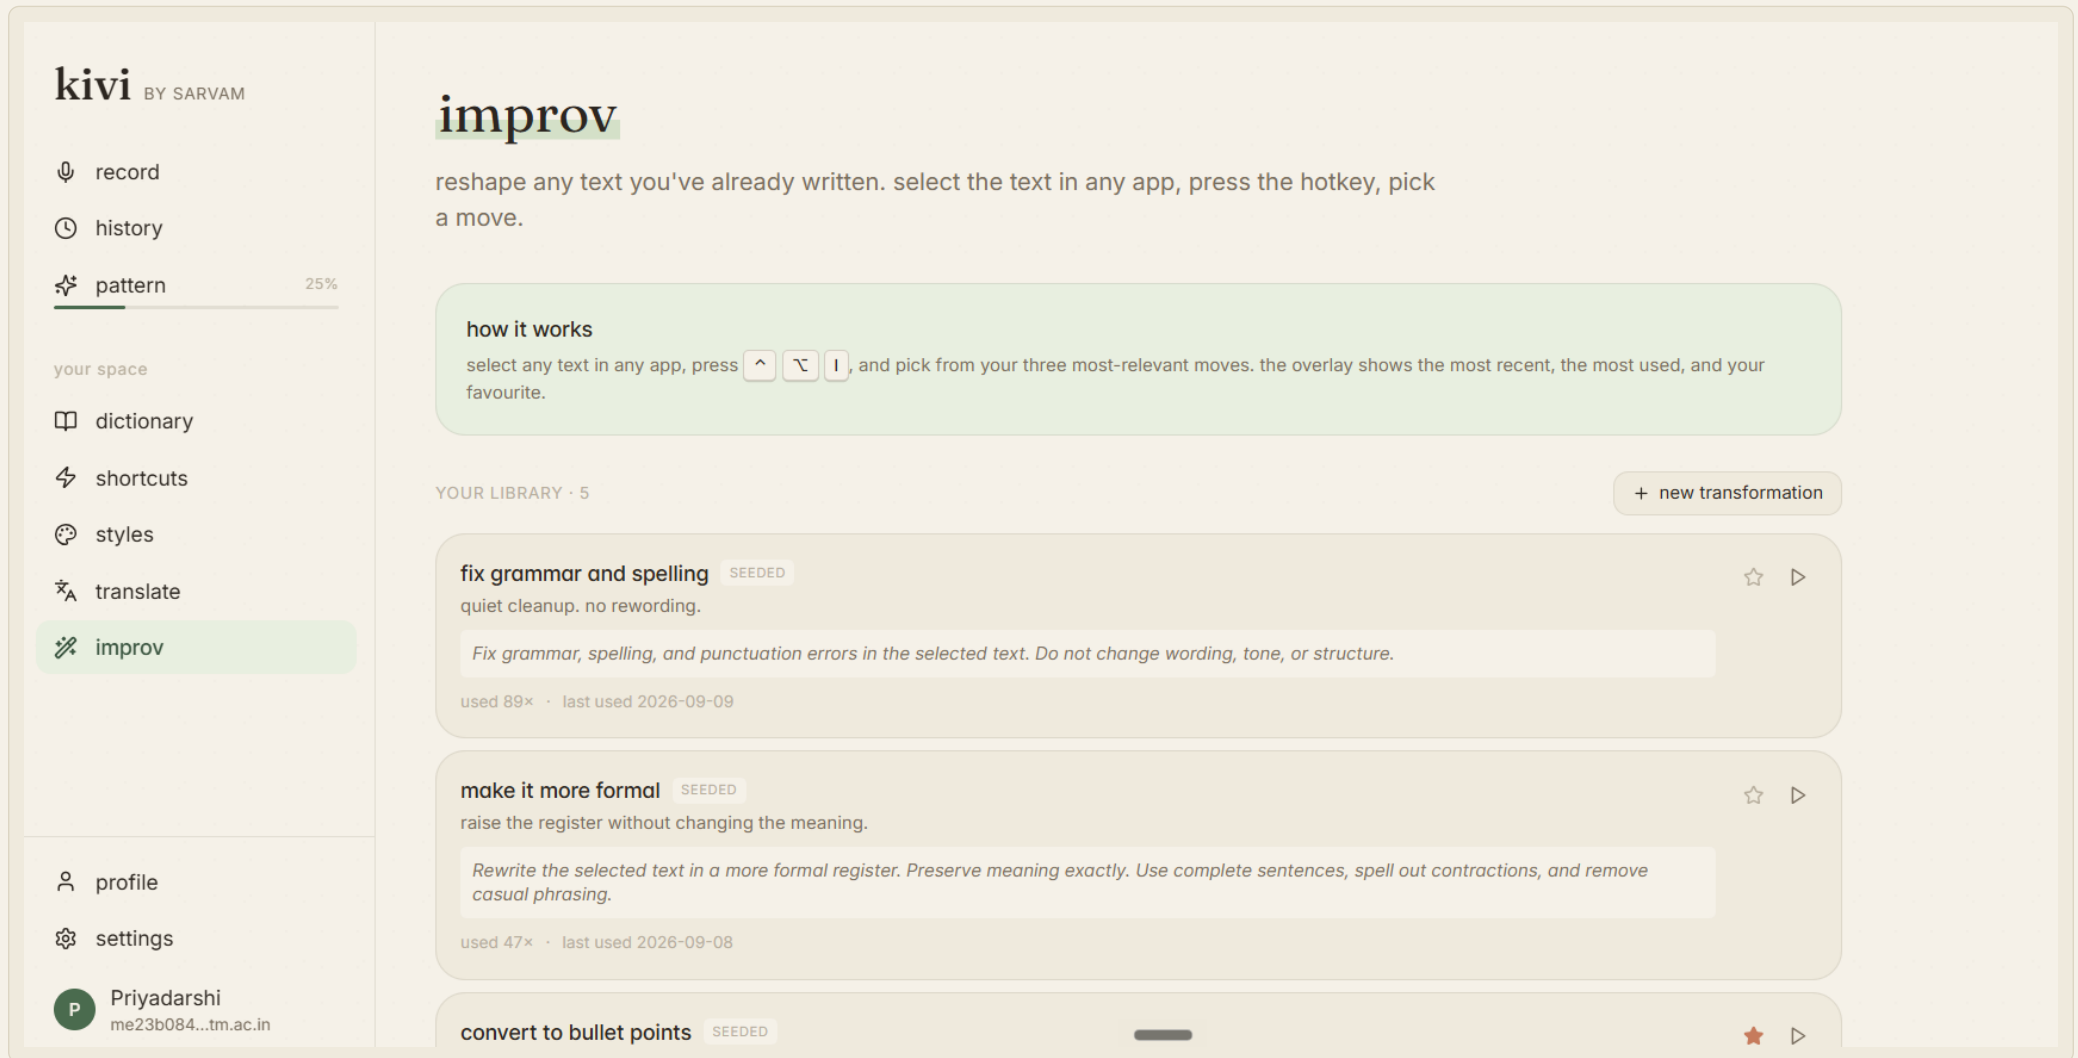

Translate

New top-level feature. Saved profiles with source language, target language, and script (native or roman). Live examples per profile. Own hotkey: **^⬆T**.

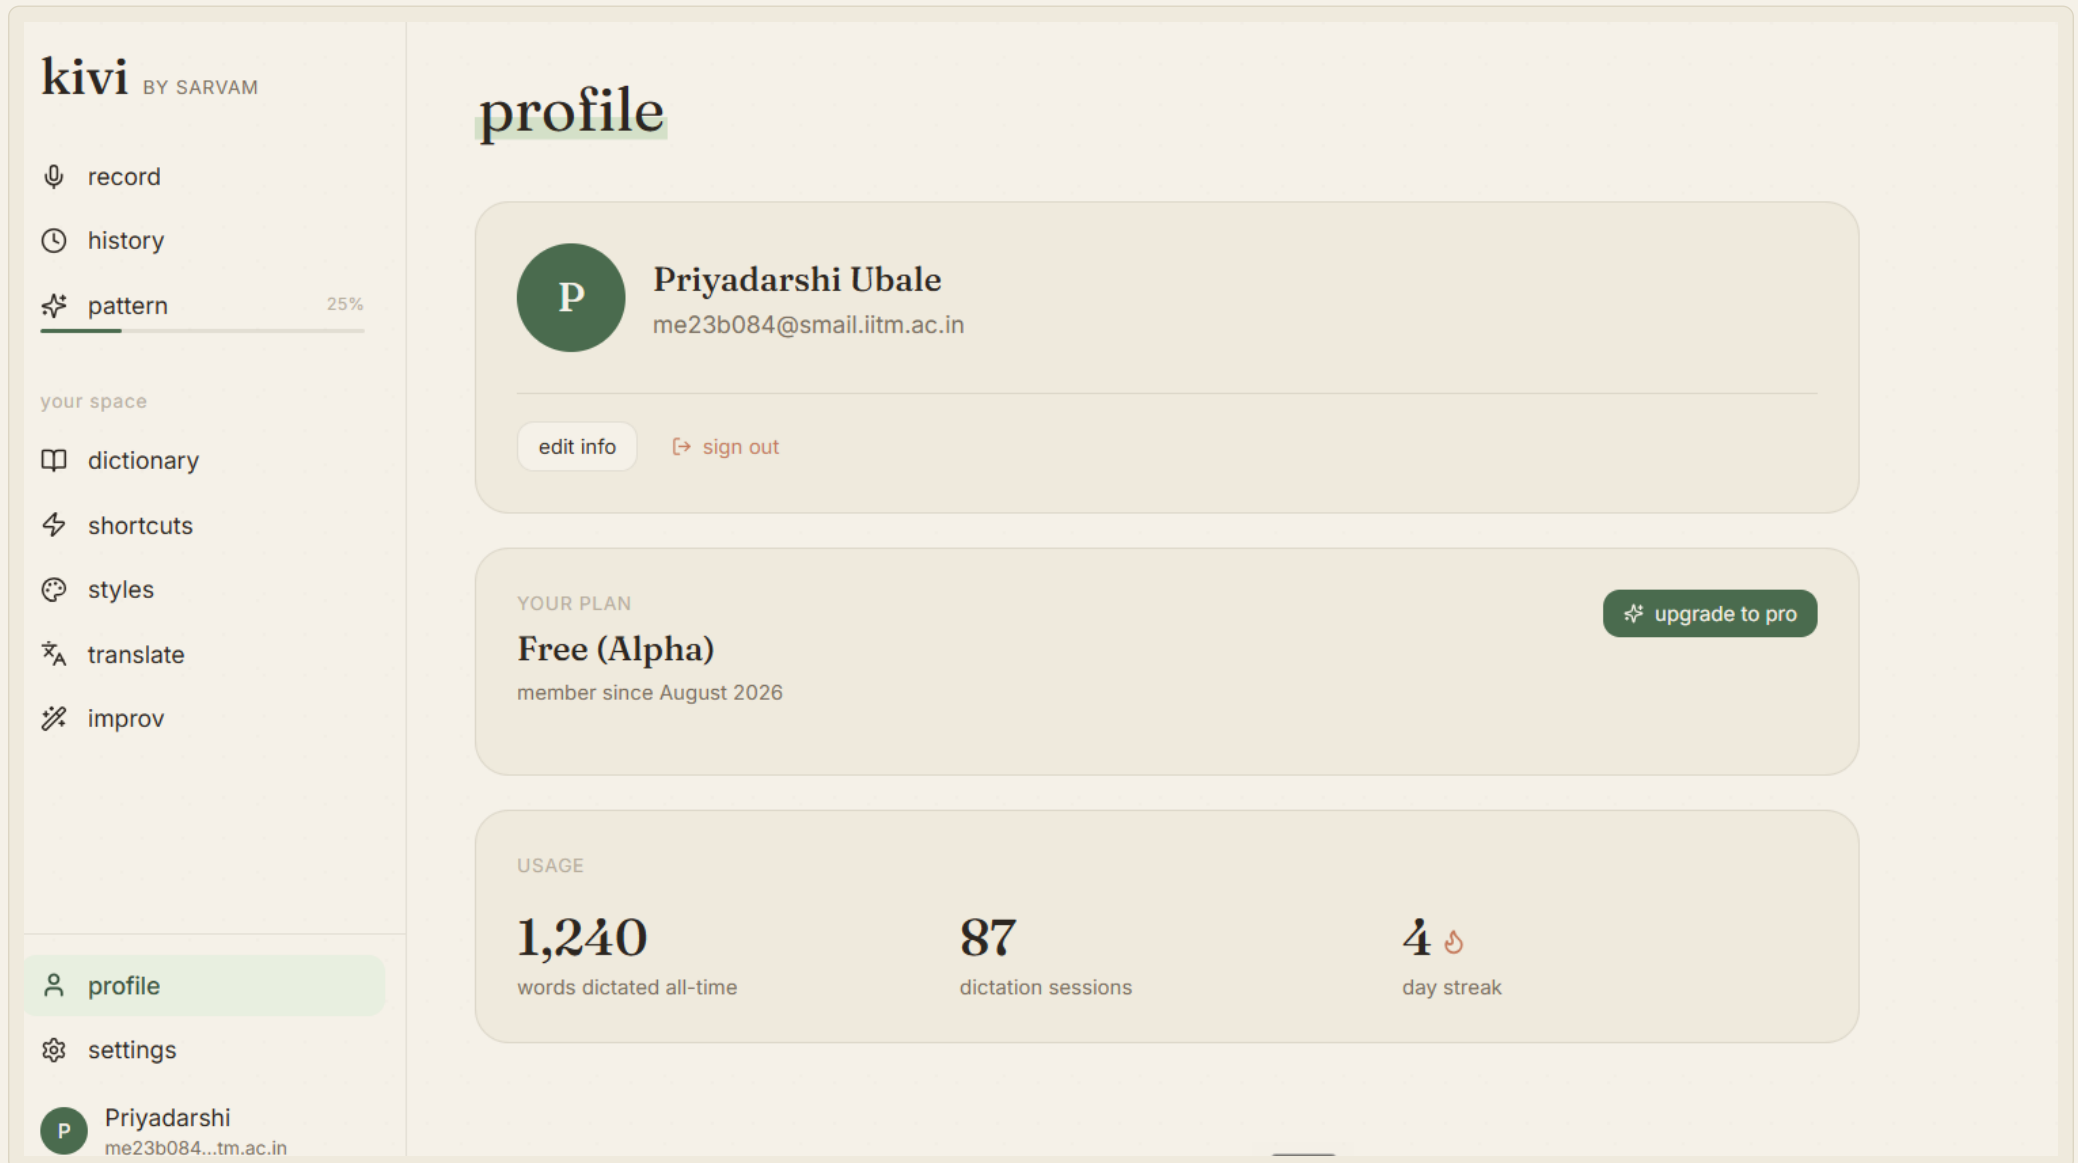

Improv

New top-level feature. On-demand transformations of any selected text. Library shows all transformations sorted by use count; the overlay picks three (recent, most-used, favourite).

Profile

Account info, plan status, usage stats (words dictated all-time, sessions, day streak). Adjacent to but separate from Settings.

Settings — general

Left sub-sidebar: How kivi behaves (general, language & script, the circle, system) and You & your team (plan, invite, team, privacy, account, advanced). New "language & script" section highlighted.
